FOX BLOCKS TRAINING PROGRAMS

As Fox Blocks expands throughout North America, training courses follow to ensure proper knowledge and techniques are used during installations.

Trainings are tailored to the region and focus on contractors, building officials, Engineers/Architects, and building supply yards.

When installing contractors complete a training, they are required to complete the proper paperwork to earn a wallet card (see at right). This wallet card can be used when asked for by building officials.

As contractors gain experience, Fox Blocks rewards them with higher level wallet cards. This allows us to understand how qualified the contractor is for larger, more complicated Fox Blocks jobs that are looking for installers.

TRAINING OBJECTIVES
1) Understanding ICF
2) Estimating your job
3) Crew Sizing for your job
4) Basic Installation of the Fox Block Line-Up
Why Contractors are Choosing Fox Blocks

 FOX BLOCKS
 END VIEW SIZING

NOTES:

1) Straight Blocks are 48" in length.

2) All block have 2 5/8" EPS for consistent R-Value.

3) Rebar spacing is consistently 16" o/c and lower truss is 8" o/c from top or bottom of upper truss.

4) All block work with each other, example the 4" block will connect to all sizes of block.

5) The 4" block is the size of a 2 x 10 and the 6" block is the size of a 2 x 12 which is perfect for wood bucks.

6) Rebar notches are designed to lap rebar on top of each other to ensure proper concrete placement.
FOX BLOCKS
LINE-UP

With advice from leading contractors in the Insulated Concrete Form business, Fox Blocks has created an incredible group of blocks.

FOX BLOCKS LINE-UP INCLUDES:
(Please note: Fox Blocks are reversible. As an example, each corner block is a left or a right.)

A) STRAIGHT BLOCKS
Available in 4", 6", 8", 10" and 12".

B) STRAIGHT 1/2 BLOCK
Available in 4", 6", 8", 10" and 12".

C) EXTENDED 90˚ CORNERS
Available in 4", 6", 8", 10" and 12".

D) EXTENDED 90˚ CORNER 1/2 BLOCK
Available in 4", 6", 8", 10" and 12".

E) 45˚ CORNER BLOCKS
Available for 4", 6" and 8".

F) T-BLOCKS
Available in 6" and 8".

G) CORBEL LEDGE BLOCKS
Available in 6" and 8".

H) RADIUS BLOCKS
For 5’, 6’, 7’, 8’, 9’ and 10’ radius.
Only available in the 6” blocks.

I) TAPER TOP BLOCK
Available in 6" and 8".

J) CURB BLOCK
Available in 8" Straight and 90˚

K) 4” HIGH EXTENSION
When you need extra height or to help with openings.

L) ENERGY STICKS
One size fits all.

M) FOX BUCK
Available in 4", 6", 8", 10" and 12".
Why Contractors are Choosing Fox Blocks

THE TRUE COST OF FOX BLOCKS

To help understand the cost advantage of using Fox Blocks Industrial Strength Insulated Concrete Forms (ICF) consider the following key points:

THREE KEY AREAS GIVE YOU THE TRUE ACCURATE COST OF THE ICF YOU CHOOSE:

1) ICF BLOCK COST
   Most ICF fall to within $0.10 per square foot of each other in block cost which is a minor portion of the overall cost of the wall construction. You must get “All-In” landed ICF System cost to accurately compare.

2) ANCILLARY PRODUCT COST
   Add in all ancillary product costs that are not in the block quote. A common example is most ICF require internal truss wire to give needed strength to the system. Know what’s required within system install guidelines to produce a straight wall. See other side for examples that will save you time & money on your next job.

3) MAN HOUR RATE TO INSTALL
   Eliminating tasks will shave hours/days off the project. Installation labor is the largest portion of overall ICF cost. Seek full disclosure on man hour rates to install the ICF system you are considering. Listening to experienced installing contractors and gaining an understanding of the attributes of ICF products can make the difference between a streamlined, profitable job and one that is not.

AT FOX BLOCKS:

EXPERIENCE
   Airlite Plastics Co., the parent company of Fox Blocks, manufactured many different brands of ICF over the past 15+ years. Much experience was gained while producing over 56 million square feet of ICF. Designed, engineered and delivered to your local market.

COMPETENCE
   Airlite Plastics controls all aspects of development and production = “Industry Leading Products”.

COMMON SENSE
   We went to the field and asked the professionals what they needed to be effective and efficient. After listening to them we produced an Industrial Strength ICF called Fox Block!

STABILITY
   Since 1946 the family run Airlite Plastics business has grown and provided high quality proven products over the decades. We have and will continue to provide the highest quality products to the construction industry for years to come.
REMOVE COSTS ON YOUR ICF PROJECT

TWO PROVEN AREAS TO REMOVE COST:

1) CORNERS

**PROBLEM:** Historically, Corner Blocks have proved to be very difficult for installing contractors to hold the corner positioning or actually holding concrete during the consolidation process. Contractors have resorted to inserting internal ties, external strapping and bracing to gain needed strength. This adds cost in additional materials and man-hour rates.

**SOLUTION:** Our engineering staff at Fox Blocks developed more length to the corners and introduced the heaviest cross tie corner bracket on the market. Adding these features to our large/strong interlock stopped rotation and movement within the blocks during the pour and added needed burst strength. Having this bracket, and no less than two ties from each corner in all 45° and 90° block, eliminates need for additional strapping or internal ties.

**RESULT:** Confidence to the installing contractor, lower man hour rates, and lower material costs proven by over 9 years of successful projects. Utilizing our Fox Blocks “next generation” corner block design will save you money through time and material reductions.

**COST:** The Fox Blocks corners cost the same per square foot as the Fox Blocks straight block. Cost may appear higher than our competitors because our corners are 16" or more in length. In many cases, our corners are actually lower in cost per square foot and at the same time save you even more in time and materials.

2) TRUSS WIRE (FORM LOCK, BLOCK LOCK)

**PROBLEM:** Some ICF interlocks and slender plastic webs have caused the need of internal truss wire to aid in producing adequate strength to add rigidity to produce a straight wall.

**SOLUTION:** Two very simple Fox Blocks innovations cured this problem: 1) A bold and reversible interlock was created to hold the wall true. 2) A full height internal tie was designed to use solid stacking strength to hold the wall from settling or racking.

**RESULT:** A wall that, through design, eliminates the need for truss wire.

**USING FOX BLOCKS ELIMINATES THE NEED FOR TRUSS WIRE**

Truss wire costs over $0.50 per lineal foot and is called for at bottom of wall and then every 4 or 5 rows of block. Actual cost = Over $0.14 per sq ft in materials and at least $0.04 per sq ft labor for a total of $0.18 or more per sq ft cost. This is equivalent to $0.40 per block.
FOX BLOCKS INTERLOCK

THE OLD
For the past 20+ years the interlock of most ICF in the industry have been designed to be within 1/2" to 1" of the desired building dimension. Most contractors have been trained that it is acceptable to be this far off the desired dimension.

THE NEW
When the Fox Blocks interlock was designed, our engineering staff made the choice not to focus on being within 1/2" to 1" from the building dimension but to give the strongest interlock possible. To do this they turned the projections and recesses of the interlock parallel to the block itself and for simplicity/strength they made them 1" wide and 2" long.

_Walls should be square and built to the building dimensions. For this reason Fox Blocks recommends stacking seams when needed._

BENEFITS OF THE LARGE INTERLOCK:
- Minimized movement during concrete placement
- No adhesive required due to tightness of interlock
- Eliminates the need for truss wire within the wall
- The full height ties are always on top or 4" apart of each other

Review next page to see the proper procedure for stacking seams.
THE NEW TRAINING:

ROW ONE:
Simply start from each corner to a point within the wall. Cut one of the blocks to fit perfectly. The cut does NOT need to be on the cut lines. Measure the cut block and mark its measurement to the side of that block large enough for everyone to see.

ROW TWO:
Start at the corners again placing the corner block the opposite direction from row one to give an overlap with the block. When you reach the cut block on row one, cut the block above it to line up exactly. Again the cut does not need to be on the cut line. Measure the cut block and mark its measurement to the side of that block large enough for everyone to see.

ROW THREE:
(five, seven, nine, etc)
Should be exactly the same as row one.

ROW FOUR:
(six, eight, ten, etc)
Should be exactly the same as row two.

PRIOR TO CONCRETE:
Simply connect the vertical seam that you created, at the one point in the wall, with strapping, or plywood, on both sides of each block. Use one 12" to 24" long strap, 3" to 6" wide, made out of 1 x wood boards or plywood sheathing attached with one screw in each tie on each side of beam.

RESULTS:
We have found that the man hour rate will drop using this method because the crew spends less time thinking how they can get closer to the building dimension and more time actually being productive.

BUILDING MULTIPLE LEVELS WITH DIFFERENT SIZED BLOCK
All sizes of Fox Blocks ICF fit well on top of each other for any type of configuration with little or no modifications needed. This is simple math. Fox Blocks are reversible with 2" projections and recesses which means you will work with a 4" offset. For this reason the 4", 8" and 12" block all work well together as they are all divisible by 4". Using the same math, the 6" block attaches to all sizes of Fox Blocks with a 2" difference in tie alignment. This is not a concern as this joint line will usually happen at a floor diaphragm.

6" CORNER BLOCK ON TOP OF 8", 10" OR 12" CORNER BLOCK:
The 6" corner works well on top of the 8", 10" or 12" corner blocks when going around an outside corner. For inside corners, simply remove the projections off the corner block and continue building. You may need to create a stacked seam on one or both sides of the inside corner at which time we recommend you just move the stacked seams for each wall closer to that inside corner.

Inside Corner:
Only with 6" corner on 8", 10" or 12" corner. Simply cut projections off corner block

Outside Corner
Works Well

6" 90˚ corner block on top of 8", 10" or 12" 90˚ corner block
Why Contractors are Choosing Fox Blocks

FOX BLOCKS STUDS

You are a sheetrock, residential wood frame, commercial steel stud or siding contractor that has been trained, and are efficient with, a continuous 1 1/2" wide attachment surface @ 16" on center.

Our team at Fox Blocks agrees with this tradition and have created our ICF with the same continuous 1 1/2" wide attachment surface but increased it to 8" on center.

Just think, when attaching sheet rock or siding to Fox Blocks Insulated Concrete Forms, you can use the same training you have used until now and understand.

FOX BLOCKS ICF
• A full 1 1/2" wide
• 8" o/c to achieve industry standard 16" o/c’s
• No gap every 16" vertically due to ties touching
• Minimal settling due to ties touching
• Not effected by moisture, will not rot
• Will not move due to temperature and humidity changes
• Eliminates most sheetrock / drywall repairs
• Made of non-organic materials

OTHER ICF
• As narrow as 1" wide
• As much as 1 3/4" gap every 16" vertically due to ties not touching
• Settling due to ties not touching

FOX BLOCKS STUDS
• Recycled polypropylene
• LEED credits*
• 120 lbs+ pullout / shear strength with screws**
• Use screws that are the thickness of material plus 1 1/8" + in length.
• If the screws that you are using do not hold, try the next size longer. The tip of the screw must pass completely through the tie to achieve full strength.

** See testing results at: http://www.foxblocks.com/Resource-Center/Technical-Resources/Testing-Reports.aspx

ACTUAL FOX BLOCKS WALL
• Studs clearly marked @ 8" o/c
• Studs are in contact with each other vertically
• Studs buried into foam 5/8" for stucco application and thermal performance

WOOD STUDS TODAY
• Much larger grain than 15 years ago
• More knots and checks than 15 years ago
• Reject screws more than 15 years ago
• Prone to movement through seasons
• Prone to rot when sealed with moisture
• Prone to sheetrock / drywall repairs
• Food for insects
EXTENDED 90° CORNER

Fox Blocks engineered the 90 degree corner to hold concrete without the need for extra strapping or external bracing.

FOX BLOCKS EXTENDED CORNER FEATURES:

1) All blocks have Ties* at 8” o/c and are available in 4”, 6”, 8”, 10” and 12” cavities.

* Ties are the black recycled polypropylene members that give the block strength and provide rebar positioning.

2) Like all Fox Blocks, corner blocks are reversible so when you ask for a corner you will get the correct one every time. Each corner is left or right automatically!

3) Foam thickness is 2.625” on all forms.

4) Tie allows rebar lap splices to lay on top of each other for good flowability during concrete placement.

5) Ties are clearly marked on EPS for attachments.

6) Tie flanges are 1.5” wide and full height for ease of attachment.

7) Ties touch vertically when stacked, eliminating form settlement.

8) Each corner has a 1” hole strategically placed allowing the ICF contractor the option of inserting a full height 3/4” PVC conduit to tie all courses together for extra form support.

OTHER ICF 90s

• 5 to 5.33 total square feet of coverage
• More costly per square foot of coverage
• 16” shorter than Fox Blocks
• Only 4 ties
• Only one tie on short end
• More movement during concrete

FOX BLOCKS 90s

• 7.56 total square feet of coverage
• Less costly per square foot of coverage
• 16” longer than other ICF
• 6 ties
• Two ties on short end
• Less movement during concrete

Being 16” longer than other ICF allows you to eliminate one full straight block for every three Fox Blocks corners used. This also saves you money!

Radius on the inside face of the Fox Blocks Corners are:

4”, 6” and 8” Blocks = 3” 10” and 12” Blocks = 8 1/2”

Additional EPS was added to the 10” and 12” Corner Blocks to give additional strength for the longer distance from corner to 1st tie.

Every Fox Blocks corner has a large 100 sq. inch fastening zone in the corner.

OUTSIDE DIMENSIONS ARE:

4" Corner = 36” x 22”
6” Corner = 40” x 24”
10” Corner = 42” x 26”
12” Corner = 46” x 30”
8” Corner = 42” x 26”

Fox Blocks 90° Extended Corner Size Chart
FOX BLOCKS T-BLOCK

Sure you can build T walls with a couple of straight block and some tie wire but if you want to lower your Man Hour Rate you need the Fox Blocks T-Block.

When contractors said they needed a T-Block Fox Blocks delivered with one that is easy to use and incredibly strong.

FOX BLOCK T-BLOCK FEATURES:

1) The T-Blocks are available in 6" and 8" concrete cores.

2) Six T-Blocks per bundle (3 short and 3 long)

3) Two ties* are used at the intersection of the “T” to give maximum strength and attachment. These ties are placed in such a way as to allow proper rebar placement and ultimate form strength.

* Ties are the black recycled polypropylene members that give the block strength and provide rebar positioning.

4) Like all Fox Blocks, blocks are reversible which gives you double the options with just one block. You can choose to have the T section on the right or left of center simply by flipping the block over.

5) Foam thickness is 2.625" on all blocks.

6) Ties allow proper rebar lap splices, for maximum flowability during concrete placement and consolidation.

7) Ties are clearly marked in EPS for attachments.

8) Tie flanges are 1.5" wide and full height for ease of attachment.

9) Ties touch vertically when stacked eliminating form settlement.

10) The T-Block will give you 8" of overlap most directions.

8" T-BLOCK INSTALLATION

The unique manufacturing challenges were overcome for the 8" T-Block by establishing a 4" offset. This off-set results in rows of ties staggered by 4" if placed with factory ends against each other. The easy fix to properly line up ties is to install the T-Block and create a stacked joint at the butt end of the long T leg. Strap stack joint prior to concrete placement.

OUTSIDE DIMENSIONS ARE:

6" T - Block Short = 44" x 4.375"
6" T - Block Long = 44" x 12.575"
8" T - Block Short = 44" x 4.75"
8" T - Block Long = 44" x 8.75"
FOX BLOCKS
HV CLIP

Contractors asked for a wire clip to secure their Fox Blocks jobs together so the team at Fox Blocks went to work designing one. Fox Blocks ties are engineered to be perfectly balanced, spaced at 8” o/c Horizontally and Vertically, giving flat walls post concrete. This allowed us to put all of our design into one wire clip which helps everyone with only one sku.

**HV CLIP PLACEMENT:***

**BOTTOM ROW:** Horizontally across every joint

**CORNERS:** Horizontally across each joint Vertically on first ties

**TOP ROW:** Horizontally across every joint Vertically on second tie from every joint

**OPENINGS:** Vertically up wall on each side of openings

**BUDGET:**
One box for every 150 block ordered
One box = 250 Fox Block HV Clips

The Fox Block HV Clip has been engineered with eight bends allowing one clip to work horizontally or vertically.

Using the Fox Block HV clip eliminates the need for truss wire completely on your jobs. The result is that for about 1/2 the cost of the truss wire you will get a stronger and straighter job.
FOX BLOCKS CURB BLOCK

There has always been a need for a block that can create a ledge to support floor systems within the wall without limiting course heights. The Fox Blocks team has solved this by adding an extra attachment point within the tie. This patent pending solution allows you to form a curb with the block to support whatever you need to support.

USING THE CURB BLOCK:

1) INSTALLATION
   See following page for proper steps using the curb block

2) SHAPES AVAILABLE WITH THE CURB BLOCK:
   At this time 8" Straight and 8" 90˚ corner blocks are available with the curb block

3) RANGE OF USE:
   The Curb Block can be cut down as low as 11" from the top of the block. You can also cut up to as much as 11" from the bottom of the block to use when wrapping around concrete slabs. See page two for an example of this.

4) ESTIMATING:
   Straight blocks = 4'-0" long.
   Formula: (Total linear footage of wall - total linear footage taken up by 90˚ corners)/ 4 = Number of straight curb blocks
   90˚ corner blocks = 5'-4" each.
   Formula: Number of 90˚ turns = Number of 90˚ corner blocks

5) IDENTIFICATION:
   The Curb Block has been designed with a green tie for easy identification. By producing the ties in green, supply yards will be able to identify and send you the proper block. This will also ensure your crew will not use it in the wall at the wrong time.

6) BUNDLE SIZES:
   Straight block = 12 per bundle
   90˚ corner block = 6 per bundle

7) EXCESS BLOCK?:
   If you end up with extra Curb Block on site, you can save for next job or simply use them up within the walls you are building. The shape and size of the Curb Block is identical to the normal straight and 90˚ corner blocks.

EXAMPLE OF A GARAGE SLAB/BEAM
Using the Curb Block in a garage situation allows a raw concrete finish on the interior face, eliminating the need to cover EPS. Any height beam or wall can use curb block on top row. Optionally, a field cut taper can be cut into outside face for extra bearing.
FOX BLOCKS CURB BLOCK INSTALLATION & USES

INSTALLATION STEPS:

STEP 1
Separate Curb Block bundles and set aside until needed. You can identify the Curb Block by the green ties.

STEP 2
Decide where you need the concrete shelf elevation to land and either mark and rip-cut the block with a circular saw or set a fence on a table saw and make your cut. Finish cut by cutting the tie with a handsaw.

STEP 3
Attach forming to the Curb Block inner ties. Simply screw two #8 coarse threaded screws to each tie to withstand concrete pressure. Fox Blocks recommends the use of 1/2” or thicker plywood or equivalent.

STEP 4
Place concrete as normal. For best results Fox Blocks recommends properly consolidating entire wall including Curb Block.

STEP 5
After sufficient curing remove form boards. You now have a solid concrete ledge for supporting what you need supported.

STEP 7
If you need extra support a taper can be cut prior to concrete placement to allow for up to a 6 1/4” ledge.

CURB BLOCK USES:

- Hollowcore
- Precast
- Dimensional Wood Floors
- Engineered Wood Floors
- Truss Floors
- Brick
- Garage Slabs
- Creating Recesses (See Below)
- Hambro Floors
- Pan Deck

EXAMPLE OF A WALL RECESS
This type of application will be treated as an opening in the wall and will require extra reinforcing within the concrete (rebar). The Curb Block will allow openings up to 22” in height using two blocks.

WOOD FLOORS
For the real life example above we cut off 6” from the left side, turned the cut-off over and connected to the right side creating a 12” curb. This works well with wood floors giving you ultra strength without any concerns of moisture in the future.
FOX BUCK
CONTINUOUS INSULATION

The Fox Buck is a certified, fully integrated, continuous insulation window and door buck for commercial and residential ICF wall openings. Fox Buck completed 3rd party testing and obtained State of Florida product approval (FL 17775) for all of Florida, including Miami-Dade counties. To obtain certification and Florida code approval, the Fox Buck met and passed several tests related to wind and impact resistance, moisture and air infiltration, and fire related tests. The Fox Buck can be used in place of pressure treated wood bucks that tend to expand, contract, warp and move within the high moisture climates.

<table>
<thead>
<tr>
<th>FOX BUCK NUMBERS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Sizes</td>
</tr>
<tr>
<td>Total Width</td>
</tr>
<tr>
<td>Total Length</td>
</tr>
<tr>
<td>Bundle Quantity</td>
</tr>
<tr>
<td>Bundle Weight</td>
</tr>
</tbody>
</table>

The 1” x 1” notches create a dual barrier against drafts and moisture penetration. When installed properly, the concrete barrier protection is continuous around the entire opening. These barriers also anchor the Fox Buck to the wall with enough strength to hold in most weather* conditions.

* Contact Fox Blocks for high wind anchoring recommendations.
FOX BUCK INSTALLATION

INSTALLATION STEPS:

STEP 1
a) Build wall as normal with opening 4” larger than rough opening.
b) Ensure all opening rebar is properly placed and secured.
c) Double check opening measurements.

STEP 2
a) Cut sides to length and notch each end 1” as in photo.
b) Place Fox Buck sides into place and hold with tape.
   Option: Spray foam can be used to completely seal buck to block

STEP 3
a) Cut and place top and bottom Fox Bucks
   Option: Spray foam can be used to completely seal buck to block
b) Penetrate all slots with a nail or screw to ensure entrapped air can escape during concrete placement.

STEP 4
Cut and remove all circles in sill. This will ensure proper concrete consolidation during concrete placement.

Notes:
It is preferred to have these circles cut out prior to placing the Fox Buck sill in place. This will eliminate any foam cutouts accidently falling into wall cavity.

Holes can be cut square to allow maximum hole size for concrete placement.

STEP 5
Brace inside opening to hold square during concrete placement.

STEP 6
When openings are close to a corner, strapping is required to hold corner in place during concrete placement.
FOX BLOCKS ENERGY STICK

How do you improve an Insulated Concrete Form wall that already out-performs most wall systems in all climates? You move the concrete mass toward the living side of the wall. This unbalanced R-value will allow the mass to be closer to the living temperature of the conditioned space allowing for a more comfortable building.

The Fox Blocks design team had two goals: 1) Move the mass away from the harsh temperatures and 2) Increase R-value. Each Energy Stick is 8" wide, 32" tall, 2" thick and profiled to fit within all Fox Blocks. The Energy Stick is used to ensure an R-8 boost to the already high R-Value of Fox Blocks.

USING THE ENERGY STICK:

1) INSTALLATION:
   Simply insert the patent pending Energy Sticks between the plastic ties and to the outside face of wall after every two rows of blocks have been placed.

2) CORNER BLOCKS:
   Fox Block corners are naturally thicker eliminating the need to insert Energy Sticks from the corner tie on. From the last straight tie to the corner tie you will need to wedge the Energy stick in place. A spot of expanding foam will also help to secure the Energy Stick from movement.

3) OPENINGS/STACKED SEAMS:
   Simply cut the Energy Stick to fit in locations that are narrower than 8". When larger than 8" use expanding foam to hold cut Energy Sticks.

4) RANGE OF USE:
   The Energy Stick will fit all Fox Blocks.

5) ESTIMATING:
   3 Energy Sticks for every block ordered.
   One box = 36 Energy Sticks
   One box of Energy Sticks will fill 12 blocks

6) MAN HOURS:
   Allow 4 minutes per box when inserting for the first time (= 950 square feet of wall per hour or .001 man hours per square foot)

7) BUNDLE SIZES:
   Each box of 36 Energy Sticks = approximately 24" x 24" x 33"

SIZING AND ACTUAL R-VALUE

6" Block + 1 Energy Stick (R-30+*) = 4" Concrete
8" Block + 1 Energy Stick (R-30+*) = 6" Concrete
10" Block + 1 Energy Stick (R-30+*) = 8" Concrete
10" Block + 2 Energy Sticks (R-39+*) = 6" Concrete
12" Block + 1 Energy Stick (R-30+*) = 10" Concrete
12" Block + 2 Energy Sticks (R-39+*) = 8" Concrete
12" Block + 3 Energy Sticks (R-48+*) = 6" Concrete

* This represents the overall average wall R-value. As an example in wood frame construction a wall with R-19 batt insulation will have an overall average wall R-value of less than R-16 due to thermal bridging.
FOX BLOCKS
ENERGY STICK FACTS

BASE
The bottom of each Energy Stick is shaped to insert into the top of the previous Energy Stick. The projection is 1/2" which is the same height as the projections on the block. This way, if the projection is left on the bottom of row one, the Energy stick will rest on the footing or slab.

TOP
The top of each Energy Stick has a recess to accept the bottom of the next Energy Stick. This eliminates movement during concrete placement.

CONNECTION
The top of every Energy Stick is designed to fit snug between the ties. The lower 18" is designed to slide into the block loosely to increase production, and guide itself to connect to the top of the previous Energy Stick.

SHOULDER
Every Energy Stick has a specially designed shoulder as a stop to ensure every Energy Stick locks into the proper location.

FOX 1440
The Energy Sticks have been designed to work well in the solid Fox Blocks line as well as the 1440 line.

R-VALUE
Each Energy Stick layer will add R-8 to the wall. You can insert the energy stick on one or two faces to achieve the R-value desired. As an example, you could add three Energy Stick layers into the 12" block giving as much as R- 45+ with 6" of concrete!

ADDED BONUS
Fastening point stays consistent with standard blocks. No need for long screws for any attachments!

ENERGY STICKS IN USE
Energy Sticks have been field tested. The example above shows a wall that was 9 rows high which meant the top row used Energy Sticks that were cut in 1/2. Energy Sticks are marked with a cut line for jobs that have an odd number of rows.
xLERATOR® LEDGE REINFORCEMENT

From foundation to finish, Fox Blocks’ patented family of products helps you get the job done more efficiently. Combining industry feedback with the creativity of Fox Blocks’ product design team, we offer an impressive array of ICF product innovations that benefit the owner, the contractor, AND the design team.

FOX BLOCKS’ xLERATOR – the only product of its kind in the industry and first one to meet ACI 318 guidelines – is a patented ICF ledge reinforcement system that offers unmatched versatile performance ideal for supporting brick and stone exterior finishes, as well as slabs, floors and other structural features.

The one-piece, 4-foot long, welded wire reinforcement piece simply drops into the pre-formed slots in Fox Blocks’ ledge form.

There’s never been a faster way to meet deadlines and building code requirements, all while significantly reducing labor costs and delays associated with pre-bent stirrups or in-field rebar reinforcement.

BENEFITS INCLUDE:

• **DROP & GO**
  Fully engineered ledge system allows you to easily place the ledge form, drop in the xLerator reinforcement piece and fill with concrete.

• **ACI 318 COMPLIANT**
  ONLY xLerator meets ACI 318 guidelines for ICF ledge reinforcement.

• **WEATHER RESISTANT**
  Hot-dipped galvanized to protect from corrosion for lasting durability.

• **FULLY ENGINEERED**
  Comes complete with full engineering details for multiple applications.

• **MAXIMUM STRENGTH**
  Reinforcement in all 6 ledge corbels.

• **VERSATILE**
  One size fits both 6” and 8” ledge forms.

WHY HOT-DIPPED GALVANIZED?

Hot-dip galvanization is the process of taking steel and dipping it into molten zinc to serve as a protective coating. If rebar in a ledge form is NOT galvanized, it’s subject to corrosion because it is placed close to the outside edge of the brick ledge, sits in a foam slot, and is not completely encased in concrete. This allows water to reach the rebar and causes it to rust. As the rebar rusts, it expands, causes concrete to crack, and undermines the stability of the ledge.

Since the xLerator is hot-dipped galvanized, it protects the reinforcement from rusting and maintains the integrity of the concrete meeting ACI 318 guidelines.

APPLICABLE ACI 318 GUIDELINES

Deformed Welded Wire Reinforcement (WWR)

• Reinforcement in every corbel
• WWR 60,000 PSI Yield Strength
• xLerator meets these guidelines
ULTIMATE LOAD CAPACITY, \( PU = 2000\text{PLF} \)

<table>

<tr>
<td></td>
<td>22.5 Ft. X (20 PSF X 1.2 + 40 PSF X 1.6) = 1980 PLF</td>
</tr>
<tr>
<td>Precast Hollowcore Floor</td>
<td>14.5 Ft. tributary area or 29 Ft. clear span</td>
</tr>
<tr>
<td></td>
<td>14.5 Ft. X (60 PSF X 1.2 = 40 PSF X 1.6) = 1972 PLF</td>
</tr>
</tbody>
</table>

Notes:
1. Load capacity is based on a concrete strength of 2500 PSI or greater and to KSI Fox Blocks’ xLerator reinforcement meeting ASTM A496
2. Load factors are based on ACI 318-11.
3. Tributary floor span is the length of floor supported by the ledge form, which is commonly half of the clear span.
4. Acceptable masonry heights and floor spans shown in the table are based on the structural capacity of the ledge only and may be limited by other factors. Consult a design professional for acceptable heights or unsupported masonry and floor spans.

tieKEY® ICF MASONRY ANCHOR

Designed by Fox Blocks Wall Systems, the tieKey anchor is the only patented ICF Masonry Anchor in the market. The cast-in-place, adjustable masonry tie anchor embeds into the concrete wall formed by the Fox Blocks ICF. This award winning product was designed to provide the strength and security required when installing brick or stone veneer finishes.

SEE HOW THE TIEKEY HAS BEEN PUT TO THE TEST:

- Third party tested for tension and compression strength.
- Simplifies the installation of brick or stone exterior finishes.
- Adjustable wire tie accommodates construction tolerances and allows for larger differential movement for the brick finish.
- Provides a strong resistance to negative and positive lateral forces.
- Available in two materials: hot-dipped galvanized steel or stainless steel.
- Recipient of the World of Concrete’s Most Innovative Products Award.
How-To Section

FOX BLOCKS STEEL SHELF ANGLE ATTACHMENT

Rip cut blocks on table saw. Do not cut cross ties.

Use form plywood to cover. Common 2 1/2” deck screws work well into the 1 1/2” wide 8” o/c ties.

Post concrete remove form plywood and you have termite protection or solid concrete to attach steel angle etc.

Each section marked ‘FOX BLOCKS’ consists of a 1.5” wide continuous fastening zone buried 5/8” beneath the EPS foam.

Face view of Fox Blocks wall showing a 6” continuous concrete band

The Fox Blocks design has consistent measurements due to the cross tie locations and full height ties. This will help when laying out a job that requires continuous bands of concrete.
FOX BLOCKS RIM JOIST ATTACHMENT

There are several ways to attach a floor diaphragm to a Fox Block wall. The most common has been to simply use common anchor bolts. See bottom for several other options.

**STEPS FOR RIM JOIST ATTACHMENT:**

1) Build wall to within one row above rim joist location
2) Mark out top and bottom of rim joist location
3) Mark out o/c locations for anchor bolts
4) Cut out 4" x height of rim joist. Angle top cut up into block to allow air to escape during concrete placement.

5) Place rim joist and attach to Fox Block ties with 3" deck screws
6) Mark out anchor bolt locations and drill holes
7) Reach inside the Fox Block wall and insert the anchor bolt through the hole you drilled
8) Place washer and nut onto anchor bolt. You are now ready for concrete.

**OTHER OPTIONS INCLUDE:**

B) Fox Block corbel ledge: http://www.foxblocks.com/Resource-Center
FIELD CUT CORNERS

WHEN A MITERED CORNER IS NEEDED

1) Place a straight block on top of another block and rotate to the desired angle. Take care to place plastic ties in a position that will minimize the amount of cutting.

2) When you are satisfied with the positioning mark both block on the outside faces where they meet. Notice in the example the block was positioned so no plastic ties are cut. See Note B.

3) Cut both block and position in the wall. Take care to ensure the block has been cut so that it does not force the wall apart. It is better to be a bit short than too long. See Note A.

4) Once wall is built, stitch and brace the outside with plywood or dimensional lumber. At this point some spray foam can be used to fill in any gaps as long as you have it braced together to keep the expanding spray foam from pushing angle apart.

5) Place concrete

NOTE: Corner will have a very high load of concrete during placement. Please take the time to brace the corner properly.

Notes:
A) It is better to be short than it is to be long when making cuts. If the cuts are short you can always use spray foam once the wall is completely built, leveled and plumbed.

B) Plastic ties can be cut if needed as the corner will be braced with lumber anyway. We just try to not cut through the plastic because it takes more effort.

C) When cutting remaining rows of block ensure the cut starts at the same location as the first row so that interlock will line up.

D) Do not use spray foam until wall is completed prior to concrete.

Use screws long enough to pass through the plastic ties completely. If your screws do not hold they need to be longer.
FOX BLOCKS SHALLOW FROST/STEM WALLS

One row of Fox Blocks. Fox Blocks is designed to accept a 2 x 4 resting on top of the tie. Attach with screws through face of tie.

Footings and reinforcing to meet local building codes.

After concrete placement, cut block and remove 2 x 4 to create a shelf for slab to rest on.

Using Curb Block allows you to lower slab to give a curb that does not require any finish. Taper is field cut into the top outside edge.
How-To Section

ICF BRACING/SCAFFOLD

When building walls over three courses tall Fox Blocks recommends the use of ICF Bracing/Scaffolding.

ICF BRACING/SCAFFOLD HAVE THREE MAIN PARTS:

1) STIFF BACK WHICH IS ATTACHED TO THE STUDS IN THE WALL
   Screw to ties in block which are 8" o/c.
   One screw per block row.

2) TURNBUCKLE WHICH ADJUSTS THE WALL.
   Threaded rod within the turnbuckles tilt wall in or out as you turn it.

3) PLANK SUPPORT ARM FOR SCAFFOLD.
   Will accept two 2 x 10’s and toe kick.

* Guard rail posts are also provided for those taller jobs

WHY WE USE ICF BRACING/SCAFFOLD

Safe work site and straight walls

The use of a string line will give you straight walls.
No one has an eye good enough to straighten walls longer than 20’.

FACTS

FOX BLOCKS ESTIMATOR PRO 4

TAB 1: WALL DATA
Fill in the basics, height, length width and whatever else your job will need.

TAB 2: OPENINGS
As an option you can input openings one at a time or in groups. The data can then be transferred to the wall data page.

TAB 3: FOX PARTS
Will give you the Fox Blocks parts needed for this page.

TAB 4: WORKSHEET DATA
A printable page showing all numbers you have entered, all product required as well as additional information like bracing requirements.

TAB 5: WORKBOOK SUMMARY
This is the pricing page which allows you to input and save your price lists and gives totals for entire project.

TAB 6: REBAR CALCULATOR
Allows you to calculate total footage of rebar for your job including footings and slabs.

TAB 7: CONCRETE CALCULATOR
Allows you to calculate total concrete needed for your job including footings, piles and slabs.

TAB 8: 1440 TILT CALCULATOR
Calculates parts needed for tilt up jobs using the Fox Blocks 1440 product.

TAB 9: MAN HOURS
Import worksheet numbers and easily calculate cost of job.

FILE MENU
Save your estimates as .fox files and choose from a variety of printouts

JOB NAME & INFORMATION
Fill out the job name and client information. There is no limit to the number of levels in your project.

Go to http://www.foxblocks.com/project-estimator/ to download the full Estimator PRO 4 for Windows or MAC.

Fox Blocks Project Estimator Mobile is easy to use and available anywhere. Use for your project take offs and estimates. Project Estimator Mobile will estimate ICF quantities including: specialty blocks, opening material, ancillary products, linear feet of rebar, volume of concrete, and man hours.

Created by industry professionals with decades of intensive, technical experience in the ICF construction industry, the Project Estimator Mobile gives you the same power as the pro version. With Project Estimator Mobile, you are able to save your files on the go and access them later on your laptop or on any device where you’ve installed the app.
Estimating Fox Blocks

SAMPLE CROSS SECTIONS

Fox Blocks are designed to make walls. Take the time to understand your on site height requirements to ensure accurate material takeoffs.

FOR ALL WALLS:
• Walls can be 4", 6", 8" 10" or 12" concrete thickness
• Taper Top Block at top of wall is optional
• Bear on slab or footing designed to carry load
• Place proper rebar to meet local building codes or engineering

8' 0" WALL
6 - 16" Tall Block

8' 4" WALL
6 - 16" Tall Block
1 - 4" Tall Block

9' 4" WALL
7 - 16" Tall Block

10' 0" WALL
7 - 16" Tall Block
1 - 8" Tall Half Block

22' 0" WALL
16 - 16" Tall Block
1 - 8" Tall Half Block
**22'-0" TALL SAMPLE SHOP WALL**

When planning any wall you want full understanding of the job for accurate takeoffs and low man hour rates. The above job required a 4'-0" stem / frost wall and 16'-0" tall door openings. The contractor used the same cross section to decide the concrete lift heights. The concrete lift heights decides the vertical rebar lengths.
BASIC ESTIMATING

Fox Blocks offers three methods to calculate the block for your project:

1) Use the basic math below to quickly calculate your estimate.
2) You can go to the website www.foxblocks.com and use the Project Estimator.
3) You can go to the website www.foxblocks.com and download the stand alone Project Estimator Pro which includes most aspects of an ICF build.

ESTIMATING BASIC QUANTITIES OF FOX BLOCK FOR YOUR PROJECT USING BASIC MATH:

STEP ONE - COLLECT DATA:
Size of block needed (4”, 6”, 8” or 12”) = __A_____
Add up the total linear footage of the job = __B_____
The number of courses (rows) required:
  (Wall height in inches / 16” or use chart) = __C_____
Number of 90˚ turns for job = __D_____
Inside 90˚ turns = __E_____
Outside 90˚ turns = __F_____
Number of turns for job other than 90˚ = __G_____
Number of T-Block locations = __H_____
Square footage of openings = __I_____

STEP TWO - CALCULATE BLOCK REQUIREMENTS:
90˚ block needed: D x C (Total number of 90˚ turns times the number of rows high)
45˚ block needed: G x C  (Total number of 45˚ turns times the number of rows high)
T Block needed: H x C (Total number of T Block locations times the number of rows high)
Straight block needed: (Use chart and calculations below)

(E x 1) + (F x 2) + (G x 3) + (H x 4) = _J____ (Linear feet of wall taken up by corners and T Block)
B - J = _K____ (Total linear feet of wall taken up by straight block)
I / 5.33 = _L____ (Number of block taken up by openings. 5.33 is sq. ft. per block)
(K x C) - L = Total Straight block needed for job not including waste factor. (Add 3% for waste)

See next page for more calculations.
STEP THREE - OTHER TYPES OF BLOCK:

**Taper Block needed (only available in 6" & 8"):**
Linear feet of taper block need / 4 (4 = length of one corbel block)
Remove this number from the straight block count

**Corbel Block needed (only available in 6" & 8"):**
Linear feet of corbel block need / 4 (4 = length of one corbel block)
Remove this number from the straight block count

**Radius block needed (only available in 6"):**
Linear feet of radius block need / 1.33 (1.33 = length of one corbel block)
Remove one straight block for every three radius block needed

**Curb Block needed (only available in 8" at this time):**
Straight: (Total linear footage of wall - total linear footage taken up by 90° corners)/4 = number of straight curb blocks
Corners: Number of 90° turns = Number of 90° corner blocks
Remove this number from the 90° corner block count

**1/2 block needed (only available in straight and 90° corner blocks):**
Same formulas as straight and 90° corner blocks.

**Energy Sticks needed (will fit all block):**
Total number of block for job x 3.

STEP FOUR - CALCULATE CONCRETE:

Fox blocks volume is exactly 4", 6", 8", 10" or 12" so calculate as you would other regular concrete formwork.

The following chart will give volumes per block:

<table>
<thead>
<tr>
<th>Block Type</th>
<th>Cubic Yards</th>
<th>Cubic Meters</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>4&quot;</td>
<td>6&quot;</td>
</tr>
<tr>
<td>Straight</td>
<td>0.068</td>
<td>0.099</td>
</tr>
<tr>
<td>90 corner</td>
<td>0.07</td>
<td>0.105</td>
</tr>
<tr>
<td>45 corner</td>
<td>0.068</td>
<td>0.082</td>
</tr>
<tr>
<td>Corbel Block</td>
<td>NA</td>
<td>0.129</td>
</tr>
<tr>
<td>T Block Short</td>
<td>NA</td>
<td>0.111</td>
</tr>
<tr>
<td>T Block Long</td>
<td>NA</td>
<td>0.105</td>
</tr>
<tr>
<td>Radius Block</td>
<td>NA</td>
<td>0.033</td>
</tr>
</tbody>
</table>

STEP FIVE - MISC:

**Fox Blocks HV Clips:** One box for every 150 block ordered (One box = 250 Fox Block HV Clips)

**Bracing:** Linear feet of wall / 6'

**Fox Buck:** Linear footage of openings / 4' and round up-

**Rebar:** (Number of rows needed x Linear feet of wall) + (Linear feet of wall / spacing needed)
Add 10% to horizontal rebar total for lap splices.
Estimating Fox Blocks

MAN HOUR RATES

- To budget a job properly for efficiency in crew size
- To budget a job properly to land job
- To be profitable

Man Hour Rates (MHR) have been around for decades. Most contractors document their production rates without realizing that time / square footage built will give them a man hour rate as you would find in most cost estimating programs such as RS Means. For most Insulated Concrete Forms (ICF) this has become a common practice. Over 20 years of history have established accurate numbers to budget future jobs with.

<table>
<thead>
<tr>
<th>MHR</th>
<th>JOB TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>.055 or less Very efficient crew building a simple job with less than six corners, less than four openings and few or no embeds.</td>
</tr>
<tr>
<td>2</td>
<td>.06 .065 .07 Average job with less than eight corners, less than eight openings and less than eight embeds.</td>
</tr>
<tr>
<td>3</td>
<td>.075 .08 .085 Most common MHR for new crews on moderate or large jobs. This will cover complex residential jobs with 12 or less corners. This MHR area will also work with large commercial jobs with basic 16&quot; o/c rebar and few openings.</td>
</tr>
<tr>
<td>4</td>
<td>.085 .095 .10 .105 Very complex residential with 12 or more corners and many openings and embeds. Also includes commercial jobs with many openings and embeds or more than 3 levels in height.</td>
</tr>
<tr>
<td>5</td>
<td>.11 and over ICF jobs with at least three of the following: More than 8 short corners (30&quot; or less), high seismic rebar design, more than 20 openings, many embeds, extreme weather, using the wrong scaffold for wall height, over 3 levels in height.</td>
</tr>
</tbody>
</table>

Square foot of Job (SFJ) = Length * Height (of Fox walls being built)

$SFJ * MHR = MAN HOURS TO BUILD JOB$

Example: Job has 180 Lineal feet (LF) of wall that is 12' tall. $180 \times 12 = 2160$ square feet (SF)
Job has 6 corners with 6 openings and basic 16" o/c rebar design. Crew has a bit of experience and ICF scaffold is used. We recommend aiming for a .075 MHR but use .085 MHR as a budget number. With experience you will become more efficient, landing more work with more profit.

$2160 \times .085 = 183.6$ Total Man Hours (TMH) for job
$183.6$ TMH / 6 man crew = 30.6 Total Crew Hours (TCH)

These numbers are estimates only. Many factors will effect the outcome of a job which needs to be taken into account. Please document all work and reflect back to your own crews history when completing budgets for upcoming work. We would like to thank contractors for sharing past history allowing us to build accuracy into this document.
Appendix

**TECHNICAL PERFORMANCE DATA**

**Fox Block ICF Wall System**

**CONCRETE WALL CONSTRUCTION (4", 6", 8", 10" & 12" Reinforced Structural Concrete Core)**

Design criteria for the structural concrete wall system
ACI 318 design standards for straight wall concrete construction
Recommended concrete consolidation

Fox Blocks Installation Manual

Prescriptive Design of Exterior Concrete Walls
PCA 100-2012, IRC R404.1, R611, ACI 332

Average weight of the reinforced structural concrete
150 lbs. / cu. ft. (including steel reinforcement)

Thermal Mass (form & 4" reinforced concrete core)
50 lbs. / sq. ft.

Thermal Mass (form & 6" reinforced concrete core)
75 lbs. / sq. ft.

Thermal Mass (form & 8" reinforced concrete core)
100 lbs. / sq. ft.

Thermal Mass (form & 10" reinforced concrete core)
125 lbs. / sq. ft.

Thermal Mass (form & 12" reinforced concrete core)
150 lbs. / sq. ft.

Recommended concrete core compressive strength
Minimum 3000 psi for the walls (minimum 2500 psi for footings)
Recommended concrete core slump flow for pump mix design
4" ICF - 6" to 7"; 6" ICF - 5.5" to 6.5"; 8", 10" or 12" ICF - 5" to 6" Recommended aggregate size for the concrete mix design
4" ICF - 3/8" max.; 6" ICF 3/8" to 1/2" max; 8", 10" & 12" ICF - 1/2" to 3/4" max.

**PRODUCT PERFORMANCE & THIRD PARTY TESTING**

**Expanded Polystyrene (EPS) Testing:**

- **EPS Foam Resin Modified low pentane, B/C bead size (resin is self-extinguishing)**
- **EPS Average Manufacturing Density / Type**
  - Type 1.5 lbs. / cu. ft. (Type II, Rigid Cellular EPS Foam Plastic)

**ASTM C578, EPS Thermal Insulation Properties**

**CAN / ULC S701, EPS Thermal Insulation Properties**

**Performance Testing:**

- Sound Transmission Class (STC), ASTM E90, STC 45-50+

**Environmental, Safety & Energy Performance:**

- **No HCFC's or CFC's emitted during the manufacturing process**
- **No toxins or formaldehydes produced**
- **Plastic ties are recycled and the EPS Foam forms are recyclable**

**Products & Energy Efficient Accessories:**

- **Energy Stick R-8 / Stick**

**Energy Efficiency Data & Performance:**

- **Thickness of the EPS**
  - 2.625" / wall panel (5.25" total EPS thickness)
- **R - 4.17 (at 70 degrees Fahrenheit)**
- **R - 23.5+ / Block (calculated in accordance with ASHRAE 90.1)**
- **K - 0.24 / inch (at 70 degrees Fahrenheit)**
  - 0.002 cfm / ft²
  - Greater than R = 32

**Storm Safety:**

- **Wind Capacity**
  - Fox Blocks ICF Walls can be designed to meet code requirements
- **Seismic Zones**
  - Fox Blocks ICF Walls can be designed to meet code requirements
